

MedGemma-27B-text Qwen3.8-27B Mean (soft target)

Agreement

Case: 45-year-old female. A 45-year-old female patient presenting with dyspnea, tachypnea, and tachycardia referred to our radiology department to exclude pulmonary embolism.

Question: Should the most appropriate initial study use contrast?

Outcome

Both teachers rank "IV contrast" first.

Retained.

Label:

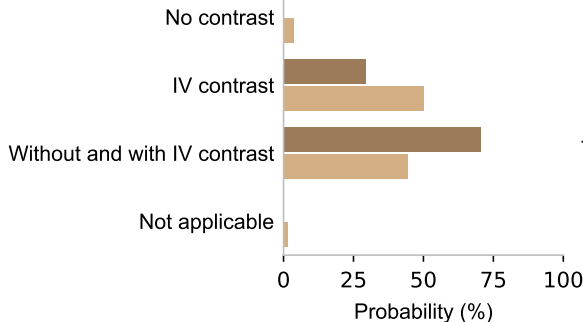

IV contrast

Target: mean of the two distributions

Disagreement

Case: 47-year-old male. A 47-year-old man with two weeks history of headache and vomiting.

Question: What contrast does the best initial study need?

Outcome

MedGemma ranks "Without and with IV contrast" first; Qwen ranks "IV contrast" first.

Discarded.
